# Hardik Khichi

## Role

4.7y exp · 3.5y IC · 1.2y Lead · 4 Careerspan screens

### 📋 CANDIDATE BOTTOM LINE

*This zero-to-one platform architect is a strong fit based on my screens because who has built and shipped a production ML SaaS platform end-to-end, owning frontend, backend...*

**👍 Take This Meeting — 89/100**

📊 **SKILLS SIGNAL** Screen-verified **76%** Resume-only **20%**

## 🔍 What the Resume Can't Tell You — Behavioral signals from Careerspan screens

### Zero-To-One Platform Architect

*"Built an ML SaaS platform from whiteboard to production"*

— As founding engineer at Keysight, architecting a platform that grew to serve hundreds of daily users including Apple, Samsung, and Volkswagen

### Full-Stack Boundary Crosser

*"Owned frontend, backend, infra, and AI components simultaneously"*

— Across Keysight and American Express, consistently stepping beyond ML specialization to deliver complete product experiences end-to-end

### Feedback-Driven Iterative Builder

*"Triaged user feedback and shipped improvements across adoption waves"*

— Scaling Keysight's ML platform from internal beta through global external adoption, translating diverse user needs into roadmap priorities

### Reliability-First Production Engineer

*"Engineered instant rollback, automated provisioning, and real-time observability"*

— Operating mission-critical ML infrastructure at Keysight supporting 6G and autonomous vehicle workloads where downtime meant blocked research pipeline

## ❓ Questions That Matter — Key areas to probe in the interview

### End-to-End Solution Delivery

*"Walk me through a project where you owned a feature from initial design through production deployment. What were the key technical decisions you made, what tradeoffs did you navigate, and how did you handle the handoff between prototyping and production-readiness?"*

### AI Prototyping to Production

*"Describe an AI/ML feature you took from prototype to production. What changed between the proof-of-concept and the production version — in terms of infrastructure, data pipelines, monitoring, or model serving — and what surprised you most during that transition?"*

### Vector Search Techniques

*"Have you worked with vector databases or embedding-based search in any of your projects? If so, how did you choose your embedding model and indexing strategy, and what retrieval quality or performance challenges did you run into?"*

### SOC 2 Compliance

*"What's been your exposure to SOC 2 or similar compliance frameworks? Have you ever had to modify how you build, log, or deploy software specifically to meet compliance requirements?"*

## ↔ Your Priorities → Fit — How candidate maps to role requirements

### End-to-end backend delivery

**Strong fit**

Demonstrated ability to deliver full solutions from prototype to production, which is core to a backend engineer role

### AI/ML feature development

**Strong fit**

Strong signals in both prototyping and productionizing AI features — rare combination that reduces handoff friction

### Production reliability and testing

**Verify in meeting**

Feature reliability is flagged as a strength but no specific backend tech stack listed — need to confirm depth with their actual infrastructure (databases, queues, observability)

### Vector search and retrieval systems

**Gap**

Explicitly flagged as a weak area — if the role involves RAG pipelines, embedding search, or similar, this requires ramp-up time or training investment

### Security and compliance posture

**Gap**

SOC 2 compliance gap means they may lack experience with audit logging, access controls, and data handling standards expected in regulated backend environments

### Backend technology depth

**More signal needed**

No specific tech stack listed — high overall score but unclear whether their backend experience maps to your stack (languages, databases, cloud infrastructure)

## 🎯 Culture Alignment Signals — Fit with company values and working style
