Hardik Khichi

AI Engineer

4.7y exp · 3.5y IC · 1.2y Lead · 4 Careerspan screens

📋 CANDIDATE BOTTOM LINE

This software engineer is a strong fit based on our screens because screens show strength in deliver end-to-end solutions and ensure feature reliability.

👍 Take This Meeting — 89/100

📊 **ALIGNMENT SIGNAL** Screen-verified **76%** · Resume-only **22%** · Newly inferred **2%**

🔍 What We Learned — Behavioral signals we uncovered through Careerspan screens

Zero-To-One Platform Architect

"Architected and shipped an ML SaaS platform from whiteboard to production"

— As founding engineer at Keysight, building a platform that grew to serve hundreds of daily users including Apple, Samsung, and Volkswagen

Feedback-Driven Product Iterationist

"Personally triaged user feedback and translated it into core features"

— During global rollout of Keysight's ML platform, managing iterative beta launches across internal teams and external enterprise partners

Solo Full-Stack Owner

"Owned frontend, backend, CI/CD, and infrastructure as sole product leader"

— At American Express, single-handedly building and operating a Database Catalog Portal used by 1,000+ colleagues while automating 150+ services

Production Reliability Engineer

"Built instant rollback, automated provisioning, and real-time observability"

— While operating Keysight's ML platform at scale with long-running deep learning workloads for mission-critical 6G and autonomous vehicle research

❓ Areas to Explore — Why we flagged these and why they matter for this role

AI Prototyping to Production Pipeline

Excellent signal; probe MLOps maturity, model monitoring, and production failure recovery.

Feature Reliability Engineering

Excellent signal; dig into testing strategies, incident response, and observability.

Vector Search Implementation Depth

Story-level signal only; need concrete examples of embedding strategies and retrieval.

SOC 2 Compliance Experience

Resume-only signal; verify hands-on role in audits versus organizational awareness.

Cross-Functional Collaboration

No signal yet; critical for end-to-end delivery roles spanning multiple teams.

↔ Your Priorities → Fit — How candidate maps to role requirements

End-to-end backend delivery

Strong fit

Demonstrated ability to deliver full-stack solutions from prototype to production, directly aligned with backend engineer ownership expectations

AI/ML feature development and productionization

Strong fit

Strong signals in both prototyping and productionizing AI features — rare combination that reduces handoff friction between research and engineering

Infrastructure reliability and observability

Verify in meeting

Feature reliability strength suggests quality mindset, but no explicit signal on distributed systems debugging, incident response, or SRE-adjacent practices

Vector search and retrieval systems

Gap

Flagged weakness in vector search techniques — if the role involves RAG pipelines, embeddings infrastructure, or similarity search at scale, this requires upskilling or pairing

Security and compliance posture

Gap

SOC 2 compliance gap means audit logging, access controls, and security-by-design patterns may need structured onboarding — critical if the org handles sensitive data

Backend tech stack depth

More signal needed

No specific backend technologies listed — need to verify proficiency in the actual stack (languages, databases, cloud providers, CI/CD) rather than assuming from general delivery strength

🎯 Culture Alignment Signals — Fit with company values and working style

✓ STRONG FIT

Ownership Mentality

Solo product leader at AmEx owning end-to-end delivery.

Ship Over Perfect

Built platform from loosely defined requirements, made.

✗ CONCERNS

None identified

? VERIFY

Small, remote team

Scrum Master and workstream representative roles imply.

Written Communication

Represented India Database Workstream, managed Jira boards.

Informal Culture Fit

Insufficient data to assess.
