Archit

Sr. Backend Software Engineer

5.0y exp · 3.7y IC · 1.3y Lead

📋 CANDIDATE BOTTOM LINE

Based on 3 Careerspan Screens (~60 min)

Senior backend engineer and zero-to-one platform founder with distributed systems and ML integration chops. Three Careerspan screens: immediate impact on alternatives data workflows, light ramp on serverless specifics.

🤔 Proceed with Caution — 75/100

📊 **SKILLS SIGNAL** Screen-verified **58%** Resume-only **36%**

↔ Priority Alignment Matrix

System architecture & technical leadership

Strong fit

Candidate demonstrates proven ability to architect solutions, define tech stack, and lead initiatives—core backend engineer responsibilities.

Cross-functional ML collaboration

Verify in meeting

Strong collaboration score but Python is flagged as a gap. Probe how they collaborate without strong Python—are they API/integration focused or is Python fluency understated?

Python for backend development

Gap

Python is fundamental for most backend roles, especially ML-adjacent ones. This is a material skills gap requiring upskilling or role redefinition.

Database & search technologies (DynamoDB, OpenSearch)

More signal needed

Gaps in specific technologies may be offset by strengths in 'define technical stack'—did they choose alternatives (PostgreSQL, Solr) or lack exposure entirely? Context matters.

Security compliance

Verify in meeting

Gap in security is risky for backend roles. Assess: Is this awareness gap (knows but hasn't owned) or skills gap (doesn't know)? Former is manageable; latter is concerning.

Technical documentation

More signal needed

Documentation gap conflicts with 'lead project initiatives.' Probe whether they delegate docs or if leadership claims are overstated.

🎯 Culture Alignment Signals

✓ STRONG FIT

- Ownership Mentality
- Collaborative Mindset
- Drive for Innovation

✗ CONCERNS

None identified

? VERIFY

- Client Centricity
- Learning Orientation

🔍 What Our Screening Validated

Zero-To-One Platform Founder

"Founded Assignment platform from PoC to full product while leading and mentoring a team of 8 enginee"

— At Embibe, transforming a nascent idea into a production system serving millions of learners, requiring iterative development cycles and stakeholder a

High-Stakes Migration Architect

"Led critical redesign of user timeline backend, overhauling database schemas with zero-downtime migr"

— During Quince's mission-critical exit from Shopify to handle $15M daily revenue and 100k+ orders, where any downtime would mean direct revenue loss

Operational Intelligence Builder

"Designed LLM-powered fraud review pipeline using RAG to generate investigation reports delivered to "

— At Quince, creating human-in-the-loop automation that combined order data, payment signals, and historical patterns to streamline operational workflow

Peak-Load Scaling Strategist

"Built SOPs and infrastructure automation to support 5× traffic spikes during Black Friday and Cyber "

— Leading up to Quince's highest-revenue events, proactively driving EKS replicas, RDS sizing, and cache optimizations to ensure system resilience under

❓ Questions That Remain

Architect and maintain solutions

"Tell me about a complex system you architected from the ground up that had to handle significant scale or technical constraints. Walk me through the key architectural decisions you made, what tradeoffs you considered, and how the system evolved over time based on real-world usage."

Lead project initiatives

"Describe a time you led a project that involved coordinating multiple teams or stakeholders with competing priorities. How did you align everyone toward a common goal, what challenges arose during execution, and what would you do differently?"

Security Compliance

"What's your approach to embedding security and compliance considerations into the systems you build? Can you walk me through how you've handled security reviews, compliance requirements (like SOC 2, GDPR, etc.), or vulnerability management in a past project?"

Python Programming & DynamoDB

"Walk me through a recent Python project where you worked with DynamoDB. How did you model your data, handle query patterns, and manage operational concerns like capacity planning or performance optimization?"
